# GV103: Introduction to International Relations 

Dr. Philip Arena

Mathematical Preliminaries

## Introduction

- Four goals for this lecture
(1) Introduce some basic terms and concepts
(2) Discuss measurement of political phenomena
(3) Explain calculation \& importance of expected values
(9) Review rules of arithmetic and algebra

## Terminology I

## Variable

An alphabetic character, Greek letter, or word that represents numeric values which differ across observations.

## Constant

An unchanging numeric value, sometimes represented with an alphabetic character when the value is arbitrary or unspecified.

## Example

File Edit View Insert Format Iools Data Window Help

| B 36 | $\quad$ |
| :--- | :--- | $\mathrm{E}=$

## Terminology II

## Probability

A measure of how likely something is to occur. Typically written as $p r(x)$ and expressed in decimal form.

## Conditional Probability

A measure of how likely something is to occur given a set of conditions. Typically written as $\operatorname{pr}(x \mid c)$.

## Levels of Measurement

- Variables can be measured at three different levels
- Nominal
- Ordinal
- Interval/Ratio
- Some variables incorporate multiple individual components
- Indexes
- Predicted values/probabilities

## Examples

- Power
- Conceptually, ability to alter others' behavior
- Cannot be measured directly
- We can measure material factors that likely grant power
- $m$ scores, CINC, GDP
- Democracy
- Conceptually, governance by the people
- No consensus on relative importance of process, outcomes
- Polity, V-Dem, binary measures

## A Look at the $m$ Scores

## Expected Value

- Let $x$ be a random variable
- Each of $N$ outcomes occurs $w /$ probability $p_{i}$ and has value $z_{i}$
- The expected value of $x$ is denoted $E(x)$
- And is equal to $\sum_{i=1}^{N} p_{i} z_{i}$
- Which can also be written as $p_{1} \times z_{1}+p_{2} \times z_{2}+\ldots+p_{N} \times z_{N}$

## Example: Expected Payout of a Bet

- You and a friend place a wager on the outcome of an election
- Friend agrees to pay £20 if long shot wins
- You will owe $£ 10$ if the candidate/party that is ahead wins
- Long shot estimated to have $35 \%$ chance to win
- You expect to win 50 pence
- $0.35 \times 20+0.65 \times(-10)=7-6.5=0.5$

## Basic Rules

- Arithmetic properties
- Commutative: $a+b=b+a, a \cdot b=b \cdot a($ or $a b=b a)$
- Associative: $a(b \cdot c)=(a \cdot b) c=a \cdot b \cdot c$ (or $a b c)$
- Distributive: $a(b+c)=a \cdot b+a \cdot c($ or $a b+a c)$
- Fractions
- Beware inappropriate cancellations
- $\frac{a+b}{c+b} \neq \frac{a}{c}\left(\right.$ ex: $\left.\frac{1+2}{3+2} \neq \frac{1}{3}\right)$
- Do not break up additive bonds in denominators
- $\frac{a}{b+c} \neq \frac{a}{b}+\frac{a}{c}\left(\right.$ ex: $\left.\frac{1}{2+3} \neq \frac{1}{2}+\frac{1}{3}\right)$

## Factoring and Expansion

- Factoring
- Pull common term out of two or more expressions
- Ex: $a x+\frac{x}{b}=x\left(a+\frac{1}{b}\right)$
- Ex: $a x+b x^{2}=x(a+b x)$
- Expansion
- Distribute terms to eliminate parentheses
- Ex: $x\left(a+\frac{1}{b}\right)=a x+\frac{x}{b}$
- Ex: $x(a+b x)=x a+b x^{2}$
- FOIL
- Is $(a+b)^{2}=a^{2}+b^{2}$ ?
- No, $(a+b)^{2} \Rightarrow(a+b)(a+b) \Rightarrow a^{2}+2 a b+b^{2}$

## Manipulation of Equations and Inequalities

- Can add (or subtract) any quantity from both sides
- Can multiply (divide) both sides by any (non-zero) quantity
- Sign flips when multiplying/dividing by quantities $<0$
- Also flips when rotating inequalities

## Use In This Module

- Goal is not to find precise numerical value that satisfies an equation/inequality w/ a single unknown
- Here, we use algebra to generalize
- Will solve for a single variable, but only to establish cutpoints

## Cut-point

A critical value, or threshold, above which something different happens than does below.

## Example

- Suppose we have $s \geq p(h)+(1-p)(I)$
- Where $0<l<s<h$ and $p$ is a probability
- For whatever reason, we want to solve for $p$
- $\Rightarrow s \geq p h+I-p l$
- $\Rightarrow s-l \geq p h-p l$
- $\Rightarrow s-I \geq p(h-I)$
- $\Rightarrow \frac{s-1}{h-1} \geq p$
- $\Rightarrow p \leq \frac{s-1}{h-1}$
- Can say original ineq. holds iff $p \leq \hat{p}$, where $\hat{p} \equiv \frac{s-1}{h-1}$
